

CLAIMS

1. A method of transmitting symbols in a wireline multi-carrier communication system in which each symbol is modulated for transmission over a carrier group of pre-determined size, the method comprising the steps of:

5 identifying all available carrier groups; and

transmitting a replicate of the symbol on at least half of the available carrier groups.

2. A method according to claim 1 wherein the symbol is transmitted on all available carrier groups.

10 3. A method according to claim 1 additionally comprising the steps of:

applying a pre-determined phase-shift to the symbol transmitted on at least one of the available carrier groups, whereby to mitigate peaks in transmitted instantaneous signal power across all carriers.

15 ~~3.~~^{4.} A method according to claim 2 wherein all replicates are phase-shifted relative to each other.

~~4.~~^{5.} A method according to claim 1 additionally comprising the step of:

for at least one available carrier group, phase-shifting a symbol portion transmitted on a carrier in the carrier group relative to a second carrier in the carrier group, whereby to mitigate peaks in transmitted signal power across all carrier groups.

20 ~~5.~~^{6.} A method according to claim 4, wherein all signal portions within a carrier group are phase-shifted relative to each other.

~~6.~~^{7.} A method according to claim 4, wherein the step of phase-shifting is applied to all available carrier groups.

25 ~~7.~~^{8.} A method of transmitting initialisation messages in a wireline multi-carrier communication system, the method comprising the steps of:

partitioning an initialisation message into one or more symbols;

Rule 1.126
"E2805.60"

modulating one of the symbols for transmission over a carrier group
of known size;

identifying all available carrier groups; and

transmitting a replicate of said one of the symbols on each available
carrier group.

⁹
~~8.~~ A method according to claim 7, wherein the initialisation messages
are DSL messages

¹⁰
~~9.~~ A method according to claim 7 wherein the initialisation messages are
selected from the group consisting of Very High Speed Digital Subscriber Line
(VDSL), Asymmetric Digital Subscriber Line (ADSL), G.Lite and G.DMT
messages.

¹¹
~~10.~~ A transmitter for a wireline multi-carrier communication system
comprising:

a modulator for modulating symbols for transmission over a pre-
determined number of carriers; and

a carrier allocator arranged to identify all available carrier groups
having the pre-determined number of carriers;

a replicator arranged to output a replicate of each of the symbols on
each of the available carrier groups.

¹²
~~11.~~ A modem for a wireline multi-carrier communication system
comprising a transmitter according to claim 10.

¹³
~~12.~~ A wireline multi-carrier communication system comprising a
transmitter according to claim 10.

¹⁴
~~13.~~ A transmitter according to claim 10 wherein the symbols form
connection initialisation messages.

¹⁵
~~14.~~ A transmitter according to claim 13, wherein the initialisation
messages are DSL messages.

16

~~15.~~ A transmitter according to claim 14, wherein the initialisation messages are selected from the group consisting of VDSL, ADSL, G.Lite and G.DMT messages.

17

~~16.~~ A transmitter according to claim 10 additionally comprising;

5

a phase shifter arranged to determine the transmission phase on the available carrier responsive to pre-determined carrier phase-shift data.

18

~~17.~~ A multi-carrier transmission signal in a wireline multi-carrier communications system, the signal comprising:

10

simultaneous transmission of a modulated symbol over all available carrier groups.

19

~~18.~~ A signal according to claim 17, wherein a first symbol portion on a carrier in one of the carrier groups is phase-offset relative to a second symbol portion on a second carrier in one of the available carrier groups, whereby to mitigate peaks in signal power.

15

20

~~19.~~ A program for a computer on a machine readable medium for transmitting symbols in a wireline multi-carrier communication system in which each symbol is modulated for transmission over a carrier group of pre-determined size, the program being arranged to perform the steps of:

identifying all available carrier groups; and

20

transmitting a replicate of the symbol on at least half of the available carrier groups.

21

~~20.~~ A program for a computer on a machine readable medium for transmitting initialisation messages in a wireline multi-carrier communication system, the program being arranged to perform the steps of:

25

partitioning an initialisation message into one or more symbols;

modulating one of the symbols for transmission over a carrier group of known size;

identifying all available carrier groups; and

transmitting a replicate of said one of the symbols on each available carrier group.

22

21. A method of establishing a connection between a transmitter and a receiver in a wireline communication system, the method comprising the steps of:

at the transmitter, partitioning a connection initialisation message into one or more symbols, modulating each symbol for transmission over a carrier group of predetermined size, identifying all available carrier groups, and transmitting a replicate of each symbol on at least half the carrier groups; and at the receiver, receiving said replicates of each symbol, reconstructing the initialisation message from said received replicate symbols, and opening the connection in response to the initialisation message.

23

22. A method of receiving symbols in a wireline multi-carrier communication system in which each symbol is modulated for transmission over a carrier group of pre-determined size, the method comprising the steps of:

receiving signals on a plurality of carrier groups;

selecting one or more of the plurality of carrier groups responsive to a measure of respective signal quality;

recovering a symbol from signals received on the at least one of the plurality of carrier groups.

24

23. A method according to claim 22 in which the step of recovering comprises the step of:

summing the signals received on the at least one of the plurality of carrier groups.

25

24. A receiver for a wireline multi-carrier communication system comprising:

a carrier receiver arranged to receive signals on a plurality of carrier groups;

a carrier group selector arranged to select at least one of the plurality of carrier groups, responsive to a measure of respective signal quality;

a symbol recovery unit arranged to recover symbols from the at least one of the plurality of carrier groups.
